Chapter 1

Class Index

1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

LinkedList::Iterator	3
LinkedList	5
Node	8

Chapter 2

Class Documentation

2.1 LinkedList::Iterator Class Reference

Public Member Functions

- **Iterator** ([Node](#) *ptr)
- int & **operator*** () const
Dereferences the iterator to access the current value.
- **Iterator** & **operator++** ()
Pre-increments the iterator.
- **Iterator** **operator++** (int)
Post-increments the iterator.
- bool **operator==** (const **Iterator** &other) const
Compares two iterators for equality.
- bool **operator!=** (const **Iterator** &other) const
Compares two iterators for inequality.

2.1.1 Member Function Documentation

2.1.1.1 **operator"!=()**

```
bool LinkedList::Iterator::operator!= (
    const Iterator & other ) const
```

Compares two iterators for inequality.

Parameters

<i>other</i>	The iterator to compare with.
--------------	-------------------------------

Returns

True if the iterators are not equal, false otherwise.

2.1.1.2 operator*()

```
int & LinkedList::Iterator::operator* ( ) const
```

Dereferences the iterator to access the current value.

Returns

A reference to the current value.

2.1.1.3 operator++() [1/2]

```
LinkedList::Iterator & LinkedList::Iterator::operator++ ( )
```

Pre-increments the iterator.

Returns

A reference to the incremented iterator.

2.1.1.4 operator++() [2/2]

```
LinkedList::Iterator LinkedList::Iterator::operator++ (
    int )
```

Post-increments the iterator.

Returns

A copy of the iterator before incrementing.

2.1.1.5 operator==()

```
bool LinkedList::Iterator::operator== (
    const Iterator & other ) const
```

Compares two iterators for equality.

Parameters

<i>other</i>	The iterator to compare with.
--------------	-------------------------------

Returns

True if the iterators are equal, false otherwise.

2.2 LinkedList Class Reference

Classes

- class [Iterator](#)

Public Member Functions

- **LinkedList** ()
Default constructor. Constructs an empty linked list.
- **LinkedList** (const std::vector< int > &values)
Constructs a linked list from a vector of integers.
- void **append** (int value)
Appends a new value to the end of the linked list.
- void **remove** (int value)
Removes the first occurrence of a value from the linked list.
- int **pop** (int index=-1)
Removes and returns the value at a specified index.
- void **display** ()
Displays the linked list contents to the console.
- int **search** (int value)
Searches for a value in the linked list.
- int & **operator[]** (int index)
Accesses the value at a specified index.
- const int & **operator[]** (int index) const
Accesses the value at a specified index (const).
- **Iterator** **begin** ()
Returns an iterator to the beginning of the linked list.
- **Iterator** **end** ()
Returns an iterator to the end of the linked list.

2.2.1 Constructor & Destructor Documentation

2.2.1.1 LinkedList()

```
LinkedList::LinkedList (
    const std::vector< int > & values )
```

Constructs a linked list from a vector of integers.

Parameters

<i>values</i>	A vector of integers to initialize the linked list with.
---------------	--

2.2.2 Member Function Documentation

2.2.2.1 `append()`

```
void LinkedList::append (
    int value )
```

Appends a new value to the end of the linked list.

Parameters

<i>value</i>	The value to append.
--------------	----------------------

2.2.2.2 `begin()`

```
LinkedList::Iterator LinkedList::begin ( )
```

Returns an iterator to the beginning of the linked list.

Returns

An iterator to the first element.

2.2.2.3 `end()`

```
LinkedList::Iterator LinkedList::end ( )
```

Returns an iterator to the end of the linked list.

Returns

An iterator to one past the last element.

2.2.2.4 `operator[]()` [1/2]

```
int & LinkedList::operator[] (
    int index )
```

Accesses the value at a specified index.

Parameters

<i>index</i>	The index to access.
--------------	----------------------

Returns

A reference to the value at the index.

Exceptions

<code>std::out_of_range</code>	If the index is out of range.
--------------------------------	-------------------------------

2.2.2.5 operator[]() [2/2]

```
const int & LinkedList::operator[] (
    int index ) const
```

Accesses the value at a specified index (const).

Parameters

<i>index</i>	The index to access.
--------------	----------------------

Returns

A const reference to the value at the index.

Exceptions

<code>std::out_of_range</code>	If the index is out of range.
--------------------------------	-------------------------------

2.2.2.6 pop()

```
int LinkedList::pop (
    int index = -1 )
```

Removes and returns the value at a specified index.

Parameters

<i>index</i>	The index of the element to remove. Use -1 to remove the last element.
--------------	--

Returns

The removed value.

Exceptions

<code>std::runtime_error</code>	If the list is empty.
<code>std::out_of_range</code>	If the index is out of range.

2.2.2.7 remove()

```
void LinkedList::remove (
    int value )
```

Removes the first occurrence of a value from the linked list.

Parameters

<i>value</i>	The value to remove.
--------------	----------------------

2.2.2.8 search()

```
int LinkedList::search (
    int value )
```

Searches for a value in the linked list.

Parameters

<i>value</i>	The value to search for.
--------------	--------------------------

Returns

The index of the value, or -1 if not found.

2.3 Node Struct Reference
